PostMaster

ENTERPRISE

Release Notes
PostMaster Enterprise ver. 8.05

2014-15

New Features

PME Core – Replace PME License

PME v. 8.05 enables the Administrator to replace PME license through the WebAdmin interface. Earlier the Administrator was required to manually shutdown, unzip and copy the new license, and then restart PostMaster. With this new enhancement all this can be accomplished through a few simple clicks.

Location: WebAdmin > PostMaster > Configure > License

PME Core - HTTPS URL Prefix

PME v. 8.05 allows the use of HTTPS as well as HTTP protocols for links within Workflow and Mail Moderation. This will enable users to perform moderation and workflow activities by clicking on the embedded links within the email even if PME is running on HTTPS (secure server).

Location: WebAdmin > PME Mails > Advanced > Others

Feature Enhancements

Content-based Search in LDAP

PME v. 8.05 enables users to perform content-based search for email ids using the 'CONTAINS' filter. Hence, if a user were to search for email ids using 'CONTAINS=master' in the LDAP, the result would shows all email ids containing the string 'master'.

e.g. postmaster@qlc.in, grandmaster@qlc.in, etc.

Note: To enable this functionality the Admin needs to set the flag 'contain_search_type' to 'true' in the 'pm_switches.prp' file.

Identify IP address in Last Access Detail Report

This feature enhancement allows the Administrator to know exactly which IP had last accessed a particular service. It comes handy especially while determining the root cause of an issue and taking appropriate measures to resolve it.

Location: WebAdmin > PostMaster > Others > Sync Server

Display primary Domain Name in SMTP Relay response

Some SMTP Servers may require domain name to be sent along with SMTP relay response. With this new feature enhancement the Primary Domain name will get displayed in the SMTP relay response.

Note: To enable this functionality, the Admin needs to edit the 'pme.bat/pme.sh' file and add the '-DSBWD=Y' flag.

Instant delivery of Moderated mail

Earlier, post moderation, the mails used to get stuck in the 'Deferred' spool for almost 5 minutes. PME v. 8.05 sends these mails directly to active spool, reducing the in-between delays

Issue Fixes

PME Core

- After restarting PME, users' status in PME's ChatServer was displayed as 'Offline' even when they were Online i.e. 'Available'. This issue has been resolved.

- An issue relating to users not being able to engage in group chat through PME ChatServer has been resolved.

- When the 'login_samewindow' flag was set to 'true' along with 'Reset Password on First Login' field for a user, the 'Reset Password' page wouldn't display after login into PME WebMail. This issue has been resolved.

- When the 'login_samewindow' flag was set to 'true' and the user tried to login into PME WebMail, a pop-up blocker alert would get displayed. This issue has been resolved.

PME-Mail

- Earlier, Signature and Footer were appended to all mails pushed to PME SMTP server via MailPush. Ideally this should be happening only for remote outgoing mails. This issue has been resolved – now only the remote outgoing mails carry the Signature and Footer.

- Even after restricting senders through SMTP Sender Block, any user could send mails to 'all-alias'. This issue has been resolved.

- An issue relating to users being unable to view mail if PME IMAP account was configured in Nokia Lumia has been resolved.

- Calendar invitations (events/meeting) sent from MS Outlook were not getting displayed in PME WebMail. They also showed an error message saying "Problem in Retrieving message. Please try again." This issue has been resolved and now all calendar invites are visible.

- An issue relating to sender email ids not getting validated due to presence of special characters has been resolved.

- An issue relating to users being unable to view mails if PME IMAP account was configured in Blackberry Z10 has been resolved.

PME-WebAdmin

While adding a valid file extension under 'Attachment Control' section, PME popped an incorrect alert saying 'Email Address Blank/Invalid Enter proper email id'. This issue has been resolved.

PME-MIS

An issue relating to the Web MIS Reports not getting displayed properly at times has been resolved.

PME-WebCal

- An issue relating to Thunderbird not being able to publish '.vfb' files if PME was installed on Linux OS has been resolved.

- While downloading a message with 'Id length' greater than 200 characters, an 'Error Duplicate Message Id' alert used to pop up. This has been resolved – now messages with lengthier ids are also comfortably downloaded.

PME-WebMail

When users attempted replying to mails from PME 'Sent Items', the system inserted the users' email ids in the 'To' and the other email ids in the "CC" field. This issue has now been resolved – only the email ids originally present in the email are inserted in the reply, in the respective 'To' and 'CC' fields.

PME- SyncML

- An issue relating to the inability to update/delete synced events has been resolved.

- Earlier the Events/Contacts added in MS Outlook/Thunderbird before installing Funambol was not getting synced post the installation. Only those events created after the Funambol installation were getting synced properly. This issue has been resolved – now all events/contacts (created prior and post Funambol installation) can be synced effectively.
